Meeting #3

kense, for the thesis

Subconversations

- Simple LTL-like logic (X then Y), for subconversations like *Clarification* or *Active.Listening*

- Other metrics to consider, such as length and vocabulary distance

- Build on top of this?

Directions

- LTL statements and additional properties act as definitions for subconversations (i.e: respond.agree -> give.opinion, additional properties would be of interest here: length of utterance, vocab used, etc)

- Build on top of subconversations in what way?

  - Pick out important properties from traces, then what?

  - Generate sample replacements based on subconversation properties?
